

Optical Communication and Audio

Yasaka Laboratory, Research Institute of Electrical Communication

High-speed optical signal transmissions are becoming an essential technology as the number of internet users increases. In this seminar, we will learn a variety of applications of photonic technologies in the world. An analog audio and an optical circuit with a light-emitting diode (LED) and a photodetector (PD) will be fabricated and used to understand audio instruments and optical signal transmission technologies.

LED for optical
signal generation

PD for optical
signal detection
